Tax Evasion of Politically Connected Firms: Labor Mobility Channel

Ruben Enikolopov^{1,2,3} and Sergey Mityakov,⁴

New Economic School ICREA-Universitat Pompeu Fabra Barcelona IPEG Florida State University

The XI International Conference on Economics and Finance Minsk, December 23, 2019

Research Question

- What is the value of political connections created by hiring a government offical or his/her relative?
 - · Look at the effect of establishing connection, not losing it
 - Look at the role of the bureaucrats rather than elected officials

- Identify direct channels in which companies may benefit from having political connections
 - Tax evasion
 - Funds received from government

Existing Literature

- Large body of work documenting value of political connections
- Identification usually comes from deaths...
 - e.g. Fisman, 2001; Faccio and Parsley, 2009; Cheng 2018
- ...or narrow election wins
 - e.g. Goldman et al, 2013, Do et al 2016, Lehne et al 2016
- Channels through which companies may benefit from having political connections
 - Preferentical access to financing
 - e.g. Khwaja and Mian 2005; Claessens, et al 2008;
 - Increased likelihood of a bail out
 - e.g Faccio, et al 2006; Cingano and Pinotti 2013
 - More government contracts
 - e.g. Goldman et al, 2013; Baltrunaite 2016; Schoenherr 2016
 - Lax enforcement of regulation
 - Fisman and Wang 2015

Background Information

- We look at the effect of political connections with Moscow government in 1999-2003
- Headed by Mayor Yuri Luzhkov from 1992-2010
 - highly influencial politician and presidential contender at that time
 - often accused of corruption and embezzlement of funds
 - Incidentally, husband of the wealthiest woman in Russia at the time, Elena Baturina
- Several levels of city government
 - Main mayor office
 - The central governing body of the executive branch
 - Departments of the mayor office
 - Departments of finance, budget planning, public construction, etc.
 - 9 prefectures
 - 140+ upravas

Data

- The main source of data is Braguinsky, Mityakov, and Liskovitch (2014) and Braguinsky and Mityakov (2015)
- Covers all the residents of Moscow for the period 1999-2003
 - Employee-employer matched datasets
 - Reported wages
 - Value of cars owned by individuals
 - Measure of tax avoidance based on the mismatch between the two
 - Name and legal address of residency
- Banking transactions among all legal entities in Russia for 1999-2004
 - Previosly used in Mironov(2013), Mironov and Zhuravskaya(2014)

Measures

Using these data we construct the following variables:

- Dummy for the presence in a firm of at least one employee, who previously worked for one of the four groups of government offices
- Same but consider only top government officials
 - Defined as being in top 10 percent in the wage distribution of the respective government agency
- Same but for the household membes of (top) government officials
 - Household members defined as those with same last name residing at the same legal address

Specification

In the baseline regressions we estimate the following regression

$$Outcome_{i,t} = \beta Connected_{j,t} + \lambda \mathbf{X}_{i,t} + \delta S_{j,t} + f_j + \phi_i + \varepsilon_{i,t}$$

- where
 - $Outcome_{i,t}$ is the outcome of interest for individual i at time t
 - Connected_{j,t} is the dummy variable that indicates whether firm j has a (top) ex-government official among employees
 - $X_{i,t}$ is the vector of individual time-varying controls (age, position in the company proxied by percentile in reported earnings distribution)
 - $S_{i,t}$ is the number of employees in the company.
- Sample is restricted to employees who themselves were not ex-government officials
- Standard errors clustered at the firm level

Source of Variation

- Baseline regressions do not establish causal relationship
 - Firms planning to be involved in tax evasion have more incentives to establish political connections
- Use variation in supply of former government officials
- Look at turnover of government employees in the neighborhood of the firm
 - Higher turnout is likely to increase the number of former government employees looking for a job
 - Effects are localized as long as people have constant geographical prepherance regarding job location
- Instrument: turnover of government employees below 90th percentile in the same zip code as the firm, excluding those moving into the firm itself
 - LATE is likelty to be lower than ATT, since marginal firms affected by the instrument are likely to have lower propensity to be engaged in tax avoidance

Conclusion

- We find that esteblishing new connections by hiring top ex-official from Moscow government increases tax evasion
 - income tax obligations of employees go down
 - · actual compensation goes up
- There is evidence that this effect is causal
- The effect is higher if the top official was more corrupt while working in the government
- Hiring top official also increases amount of money the firm receives from the Moscow governmentt
- The effects are also observed after hiring a relative of a top government official
 - but the effect is smaller in magnitute
- There is evidence that more lax tax enforcement is a mechanism behind this effect
